

Executive Summary

The dataset QC run analyzed 4 files and produced an average quality score of 100.0. Key issues and recommendations are listed below.

Overall Score

100.0 / 100

Grade: A+

Files Passing Threshold

4 / 4

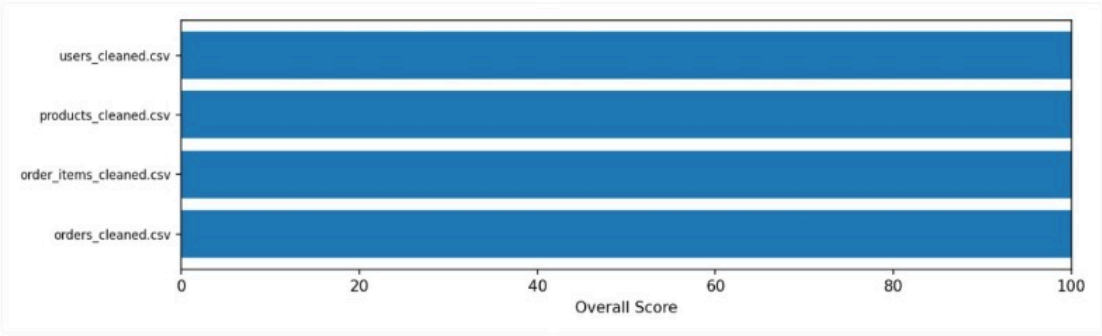

Threshold: 65%

Top Issues Found

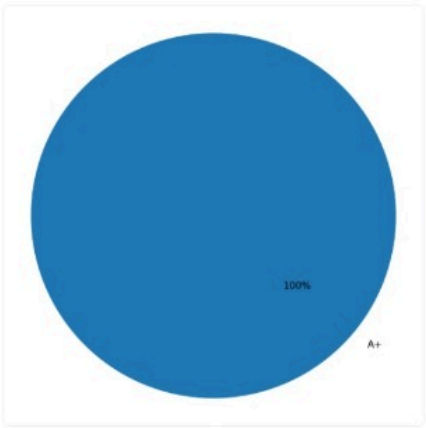

Fuzzy duplicate groups — 4155 occurrences

Low valid email rate — 4 occurrences

Score Distribution

Grade Breakdown

Per-file Summary

File	Rows	Cols	Score	Grade	Top Issues	Report
orders_cleaned.csv	1458	4	100.0	A+	- order_id (0.0%) - user_id (0.0%) - order_timestamp (0.0%)	report
order_items_cleaned.csv	15922	5	100.0	A+	- order_id (0.0%) - order_item_id (0.0%) - sku (0.0%)	report
products_cleaned.csv	1000	4	100.0	A+	- product_id (0.0%) - sku (0.0%) - product_name (0.0%)	report
users_cleaned.csv	5000	3	100.0	A+	- user_id (0.0%) - name (0.0%) - city (0.0%)	report

Detailed Findings — Top Problem Columns

Column	Files Affected	Avg Missing %	Notes
order_id	2	0.0%	Moderate missingness
user_id	2	0.0%	Moderate missingness
order_timestamp	1	0.0%	Moderate missingness
amount	1	0.0%	Moderate missingness
order_item_id	1	0.0%	Moderate missingness
sku	2	0.0%	Moderate missingness
price	1	0.0%	Moderate missingness
quantity	1	0.0%	Moderate missingness
product_id	1	0.0%	Moderate missingness
product_name	1	0.0%	Moderate missingness
category	1	0.0%	Moderate missingness
name	1	0.0%	Moderate missingness
city	1	0.0%	Moderate missingness

Recommendations

- Investigate fuzzy duplicate groups and establish deduplication rules or unique identifiers.
- Verify email capture process, apply email normalization and validation at source.
- Adopt formal schema expectations (e.g., Great Expectations) to assert column types and uniqueness constraints at ingestion.
- Add automated nightly QC runs and alerting for regressions.
- Use HMAC tokenization for PII in downstream reports, store secrets in a secure vault.
